TEXTBOOK OF ORDINARY DIFFERENTIAL EQUATION by S. Deo

A differential equation (de) is an equation involving a function and its deriva-tives. Differential equations are called partial differential equations (pde) or or-dinary differential equations (ode) according to whether or not they contain partial derivatives. The order of a differential equation is the highest order derivative occurring.

This is a textbook for an introductory course on linear partial differential equations (PDEs) and initial/boundary value problems (I/BVPs). It also provides a mathematically rigorous introduction to Fourier analysis which is the main tool used to solve linear PDEs in Cartesian coordinates. Difference Equations to Differential Equations

However, a lot of textbook (other materials) about differential equation would start with these example mainly because these would give you the most fundamental form of differential equations based on Newton's second law and a lot of real life examples are derived from these examples just by adding some realistic factors (e.g, damping ...

Differential Equations. A Differential Equation is a n equation with a function and one or more of its derivatives:. Example: an equation with the function y and its derivative dy/dx . Solving. We solve it when we discover the function y (or set of functions y).. There are many "tricks" to solving Differential Equations (if they can be solved!).But first: why?

Differential Equations - Introduction

History. Differential equations first came into existence with the invention of calculus by Newton and Leibniz.In Chapter 2 of his 1671 work Methodus fluxionum et Serierum Infinitarum, Isaac Newton listed three kinds of differential equations: $y' = f(x)$, $y' = f(x, y)$, and $y' = f(x, y, y')$. In all these cases, y is an unknown function of x (or of x and y), and f is a given function. He solves these examples and ...

Differential equation - Wikipedia

Calculus is the mathematics of change, and rates of change are expressed by derivatives. Thus, one of the most common ways to use calculus is to set up an equation containing an unknown function $y = f(x)$ and its derivative, known as a differential equation.Solving such equations often provides information about how quantities change and frequently provides insight into how and why ...

A differential equation is an equation which contains one or more terms which involve the derivatives of one variable (i.e., dependent variable) with respect to the other variable (i.e., independent variable) $dy/dx = f(x)$ Here "x" is an independent variable and "y" is a dependent variable. For example, $dy/dx = 5x$.

This technique allows us to solve many important differential equations that arise in the world around us. For instance, questions of growth and decay and Newton's Law of Cooling give rise to separable differential equations. Later, we will learn in Section 7.6 that the important logistic differential equation is also separable.

Sturm–Liouville theory. Main article: Sturm–Liouville theory. Sturm–Liouville theory is a theory of a special type of second order linear ordinary differential equation. Their solutions are based on eigenvalues and corresponding eigenfunctions of linear operators defined via second-order homogeneous linear equations.

The main theme is the integration of the theory of linear PDE and the theory of finite difference and finite element methods. For each type of PDE, elliptic, parabolic, and hyperbolic, the text contains one chapter on the mathematical theory of the differential equation, followed by one chapter on finite difference methods and one on finite element methods.
